01. PRECIOUS METALS PERFORMANCE

Precious Metals Performance

- Gold prices rose notably throughout August. In USD terms, the precious metal rose to an intra-month high of USD \$4,696oz before closing the month at USD \$4,448oz. Delivering a monthly return of 9.8%. Gold has now returned 3% year-to-date (YTD) and is closer to 30% higher than levels recorded a year ago. Prices have since pulled back slightly towards the USD \$4,300oz price point.
- Silver saw even greater gains, ending August at USD \$66.5oz up from \$57.7oz the month prior. The white metal climbed to an intra-month high of USD \$71.1oz before falling towards month-end. The metal grew by 15% over August and remains 71% higher than levels recorded a year ago.
- Platinum outperformed, gaining 14% month-on-month to USD \$1,872oz. Meanwhile, the gold-to-platinum ratio fell (-0.1) to 2.38, remaining significantly above its long-term median of 0.92 dating back to 1990.
- The gold to silver ratio (GSR) fell slightly, though it largely traded rangebound (66-68) throughout August. The ratio ended the month at 67:1 (down from 70:1), 6% above its historical median of 63.
- In Australian dollar terms, investors were marginally worse off with their precious metal investments. Gold and silver rose 8% and 13%, respectively. The appreciation in the value of the Australian dollar—which gained 1.9% vs. the greenback to end August at 0.7166—drove the lower gains.
- Gold and silver lead other major asset classes (Australian shares, bonds and cash) across 5-year, 10-year, 20-year and 25-year horizons on a compound annual growth rate (CAGR) basis.
- Seasonally, gold remains in its historically strongest quarter in USD terms. Over the long term, gold has delivered an average return of 3.4% during Q3, compared with just 1.5% in Q2, its weakest quarter on average.
- The exceptional returns for gold and silver that we have seen in the post-COVID era continue to be driven by a range of factors: including robust central bank accumulation; ongoing geopolitical tensions; ETF demand from Western nations; growing inflationary pressures; and resilient physical investment demand from key markets.

02. PRECIOUS METALS VS THE MARKET

Precious Metals vs The Market

Source: Bloomberg, CME Group

- The S&P 500 continues to sit near record highs—up 11% year-to-date at the time of writing— and outperforming gold. This gain comes off the back of strong corporate earnings, particularly from U.S. tech shares and strong capital expenditure into AI infrastructure. The index, however, remains highly concentrated around the MAG-7 (35% of the S&P 500 index by market capitalisation) which has accounted for most of the gains year-to-date.
- While the strong performance of equity markets has enriched bulls, risks remain elevated, with valuations stretched, as reflected in a current CAPE ratio of 41 versus a long-term average of 17.7. Valuations have not reached these levels since the dot-com bubble in 2000 when the S&P 500 went on to deliver three consecutive years of negative returns (-10%, -13% and -23%). Concerns over a potential resurgence in inflation, trade barriers, AI euphoria and geopolitical risks are also factors that may encourage risk-averse investors to adopt a cautious approach to equity allocations, especially once the current bullish momentum dissipates.
- Historically, the three major declines in the Dow/Gold ratio (1930s, 1970s, and 2000s), were driven by a combination of a significant rally in the gold price and/or stagnation—if not outright decline—in the U.S. equity market. (The '30s being largely driven by the latter, given gold prices were fixed at the time.) The ratio (12) remains above the historical median of 7.5 suggesting gold appears relatively undervalued and has further upside potential.
- The Gold/Oil ratio rose over the course of August, ending the month at 52 (+4). This rise was driven by the gold price increase in August. Oil prices have since spiked into September, trading close to USD \$105/bbl at the time of writing, with hostilities around the Strait of Hormuz still unresolved.
- The Gold/BCOM rose marginally in August, growing 2.5% month-on-month, after reaching an all-time high of 43.3 in February.
- Interest rate expectations have shifted materially over recent months. While markets were previously pricing in a meaningful probability of additional policy easing, persistent inflation and low levels of unemployment have led both the Fed and investors to reassess the outlook. Following the Fed's July meeting, rates were left unchanged at 3.50%-3.75%, however, members highlighted growing concern over upside inflation risks. Markets are now pricing in a 92% probability of a rate rise in September of this year ([CME Group](#)). The prospect of higher rates in the US creates a less supportive environment for precious metals in the short-term, as investors are incentivised to allocate toward higher-yielding assets like cash and bonds.
- Higher US real yields, with the 10-year real yield reaching 2.62% at the time of writing, have also supported a stronger USD, with the DXY rising to 99.6 (up from 98.8). This has reasserted the typically inverse relationship between the USD and gold, adding further pressure to gold prices despite ongoing geopolitical uncertainty.
- While CPI is well and truly below the 2022 peak of 9.1%, it remains above the Fed's 2% target. Median, mean and core inflation in the U.S. ended August at 2.6%, 2.6% and 2.4% respectively —while headline CPI sits at 3.4%. The potential for a sustained surge in oil prices raises the risk that inflation will rise throughout the remainder of 2026, which in due course is likely to support gold demand.

03. PRECIOUS METALS FLOWS & POSITIONING

Precious Metals Positioning

Source: World Gold Council

- ETF data for August suggests 120 tonnes of gold was purchased net across the course of the month. The value of all gold holdings in ETFs ended the month at USD \$615bn, a month-on-month rise of 16%. This value remains 50% higher relative to August 2025. August ETF flows was on par with January 2026, when precious metal markets were at peak euphoria.
- Over 2025, approximately 750 tonnes of gold was purchased by ETF investors, valued at approximately USD \$104B, representing the strongest period of inflows since the height of the COVID pandemic.
- Investment inflows from North American and European listed ETFs were equal highest across August, lifting by USD \$7.2b or 50.3 tonnes respectively. Followed by Asia, purchasing USD \$1.9b or 13.3 tonnes.
- Central bank purchases remain a cornerstone of demand for gold. As of end Q2 2026, Central banks have purchased net 466 tonnes of gold for the year. If these demand levels are sustained, it would not be surprising for net purchases to again be upwards of 700–800 tonnes across 2026.
- A survey conducted by the World Gold Council in June 2026 suggested elevated central bank gold acquisitions will continue, with 45% of participants expecting to increase their own gold reserves over the next 12 months, while 1% expect their institution's gold reserves to decrease.
- Speculative positioning in the gold futures market remains constructive, with gross long positioning ending August at just under 160,000 contracts. This represents a month-on-month gain of 18%.
- Gross short positioning fell marginally month-on-month, ending August just above 15,000 contracts. Short positions remain structurally light, around 87% lower relative to the highs experienced in October 2023 and 62% below their historical average since 2006, indicating limited conviction on the bearish side.
- Net positioning in the market ended August at just below 145,000 contracts. That is 38% lower than it was by the end of 2025 and 55% below levels seen a year ago. The decline reflects a growing bullish sentiment, with investors increasing their long exposure, while the continued absence of significant short interest points to a market that is cautiously bullish.

04. PRECIOUS METALS
TECHNICAL ANALYSIS

Precious Metals Technical Analysis

- The “price gap” between gold’s end-August USD spot price and its 200 DMA stood at approximately USD \$300 or -5%. At its peak this year above USD \$5,400oz, gold was trading close to 40% above its 200-DMA, marking the most extended level historically speaking since 1980.
- Silver by end July was showing even greater signs of exhausting the recent technical correction. The metal’s 200-DMA finished just below USD \$73oz, while the end-month spot price closed nearly USD \$7oz lower. This translates to a 9% discount below the 200-DMA. At its peak in January, spot silver had stretched to a 140% premium over the 200-DMA.
- Across the duration of the gold bull market, dating back to the year 2000, the average price gap between spot and the 200-DMA has been closer to 4.3%. For silver, across the same time horizon the gap has been closer to 2.7%.
- Historically, when gold and silver trade significantly above or below the 200-DMA, the price tends to mean-revert, washing out excess froth or fear from the market.
- Downside overshoots below the 200-DMA are not uncommon during corrective phases, with a trough forming up to 10% below the 200-DMA (for gold), a common scenario with respect to historical analysis conducted by [ABC Bullion](#).
- The depth of the recent pullback post January 2026, the duration of the decline, and the extent to which gold moved below its 200-DMA all fall within historical norms, lending support to the view that the July low may prove to be a significant cyclical bottom for precious metals.
- From a historical perspective, such pullbacks have typically served as healthy market consolidations and have provided attractive accumulation opportunities for medium- to long-term investors.
